

**AtMol** will establish comprehensive process flow for fabricating a molecular chip, i.e. a molecular processing unit comprising a single molecule connected to external mesoscopic electrodes with atomic scale precision and preserving the integrity of the gates down to the atomic level after the encapsulation. Logic functions will be incorporated in a single molecule gate, or performed by a single surface atomic scale circuit, via either a quantum Hamiltonian or a semi-classical design approach. AtMol will explore and demonstrate how the combination of classical and quantum information inside the same atomic scale circuit increases the computing power of the final logic circuit. Atomic scale logic gates will be constructed using atom-by-atom manipulation, on-surface chemistry, and unique UHV transfer printing technology.

## AtMol conference series 2013: "International Workshop: Imaging and Manipulation of Adsorbates using Dynamic Force Microscopy"

Nottingham - UK. April 16-17, 2013

Dynamic force microscopy (also known as non-contact atomic force microscopy) has evolved rapidly over the past decade to become an extremely powerful technique capable of not only ultrahigh resolution imaging and spectroscopy, but the precise positioning of individual adsorbed atoms and molecules.
