Graphene materials have attracted increasing interest from academic and industrial societies because of their excellent properties and a wide range of promising applications. In particular, the research and industrialization of graphene materials in China has been developing very rapidly in the past several years. Many graphene-related companies have been established for large-scale production of graphene materials aimed at industrial applications, which makes an urgent call for the standardization of graphene materials. This talk will briefly summarize the progress of industrialization and standardization of graphene materials in China, and challenges and prospects in these fields will be discussed.
